

Mentor
C Guide for Beginner

```
main()
```

func1 ()

sub func 3 ()

return -

return ...

func 2()

return ...

Return θ

- so, "return" signed the end of

a function.

- Structure of C function :

Datatype func_name(Datatype)

output data
(return)

input data

Data Memory

how does your computer

store its data? so, computer
memory looks like :

1	i
2	l
3	o
4	v
5	e
6	u
7	w
8	y
9	l
10	o/h
11	h

index → real data

when computer need data
"i" it will visit
memory with index 1

memory ..

- what's "array"? it's a block of continuous memory. Instead of its real physics memory address, it has virtual index number from 0 to

- what's pointer?
you just know every physics memory

has an address, a pointer is an address container. you can visit the address position with its pointer.

just like :

index	data
10001	
10002	
10003	
10004	♥
10005	

a pointer to 10004, called ptr
when I want to visit 10004, I can
in C programming.

use *ptr

so pointer is soul of C as well
art of C, how beautiful it is
when controlling the computer
hardware
